

VANGUARD COMPLIANCE MANAGER

Customize your DISA/STIGs baseline checks for RACF, ACF2, and TSS.

PRODUCT DESCRIPTION

Vanguard Compliance Manager (VCM) for RACF, ACF2, and TSS is an automated vulnerability assessment solution. VCM assists organizations in passing Security Readiness Reviews (SRR) for z/OS mainframe environments.

BUSINESS CHALLENGE

Passing an SRR brings mainframe system security into compliance with the security guidelines utilized within your organization. This can be internally developed guidelines, guidelines created by the Center for Internet Security (*COMING SOON*), or those developed by the Defense Information Security Agency (DISA), and utilized in partnership with the National Institute of Standards and Technology (NIST).

These stringent guidelines are considered by some in the industry as Core Security Requirements (CSR). The objective of these guidelines is to safeguard the confidentiality, integrity and availability of the sensitive information and systems. The guidelines accomplish this objective by ensuring that the operating system software, as well as its security component, is installed, configured, and managed in a way that is secure, efficient, and effective. An environment passes the SRR when the results of the review reveal that no security vulnerabilities were found.

VANGUARD SOLUTION

Vanguard Compliance Manager eases the auditing burden of an SRR by automating the step-by-step procedures. VCM collects the required information, analyzes the system software installation and configuration accordingly, and identifies the vulnerabilities found.

KEY FEATURES

- Budget sensitive
- Performs critical compliance checks
- Performs custom baseline checks
- Easy-to-Use with immediate results
- Identifies open compliance gaps

KEY BENEFITS

- Creates customizable baseline checks and reports
- Easily integrates into your existing automation solution using our extensive batch functionality
- Adherence to SRR requirements for IBM z/OS categories
- Reports security vulnerabilities for remediation
- Integrate with your existing Privilege Review Process
- Centralized Reporting for your entire organization from a single z/OS LPAR
- Automate sending reports into your SIEM solution to create dynamic and off-platform Reports
